To: Subject: STIC-Biotech/ChemLib sequence search request...

Please perform a search of SEQ ID NO:29 of USSN 09/888,164 in all commercial databases, pending files, and pre-grant pubs. Please perform this search as:

a) a regular search for any sequences comprising SEQ ID NO:29 and b) a length limited search wherein the length of the oligo hits is limited to less than 50 nucleotides in length.

The present sequence, which inhibits the replication of hepatitis B virus (HBV) in a host cell, is a single stranded antisense oligonucleotide that binds the epsilon encapsidation sequence of a mRNA intermediate derived from the HBV genome. The 1st nucleotide of the oligonucleotide corresponds to nucleotide 1884 of the HBV ayw subtype C gene, using the numbering scheme from the sequence published by Galibert et al., Nature

Single stranded oligo:nucleotide(s) for inhibiting replication of hepatitis B virus - are anti-sense to portions of the epsilon encapsidation sequence and modulate HBV function.

WPI; 1996-116796/12.

This sequence represents a probe for the preCore region of hepatitis b virus (HBV). This sequence can be used in the method of the invention for detection and/or genetic analysis of hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally releasing, isolating or concentrating polynucleic acids (I) in the sample with at least I suitable primer pair; (b) hybridising (I) with a combination of at least 2 nucleotide probes, which are applied to known locations on a solid support and hybridise specifically to mutant target sequences chosen from the HBV RT pol gene region, HBV preCore region, HBsAg region and/or HBV genotype specific target sequences, or their complements or U for T homologues; (c) detecting the hybrids formed in step (b), and inferring the HBV genotype and/or mutants present in the sample from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Synthetic.

A compsn. comprising the oligonucleotide may be used to treat chronic HBV infection by modulating a HBV related function, e.g. translation, transcription, encapsidation, replication and release from a host cell. The effect of the oligonucleotide on the levels of HBV DNA in the extracellular medium (VIR. DNA), intracellular viral replicative intermediates (HBV RI), intracellular viral RNA (HBV RNA), HBV surface antigen protein (HBSAg), HBV eantigen protein (HBBAg) and HBV core antigen protein (HBCAg), given as the EC(90) (microM, 9 days of treatment) or ND (not determined), are VIR. DNA (1.6), HBV RI (5.1), HBV RNA (>20), HBSAg (>20), HBBAg (>20) and HBCAG (18.5)

The invention relates to a novel homogeneous conjugate comprising a hepatic ligand, bifunctional linker and biologically stable oligomer binds to a sequence in a hepatic virus or pathogen and is released fr

New homogeneous prodrug conjugof pathogen-specific oligomer

conjugate con igomer useful

containing hepatic ligand for de ful for treating liver infections

for delivery

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   the conjugate by hydrolysis or reduction. The conjugate of the invention may be useful during the treatment of liver diseases including chronic viral hepatitis, cirrhosis, malaria, viral or protozoan infection and cancer, such as hepatocellular carcinoma (HCC). The current sequence is that of the NG3 A-L-P conjugate DNA component of the invention which was used to target the Hepatitis B virus (HBV) pregenome (e-site).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; zinzyme amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative; disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC the synthesis, expression and/or stability of Hepatitis C virus (HCV) or CC Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense CC and enzymes, cucleic acids such as hammerhead ribozymes, DNAzymes, CC inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed CC are nucleic acid decoy molecules and aptamers that bind to HBV reverse CC transcriptase and/or HBV reverse transcriptase primer sequences, as well CC as oligonucleotides that specifically bind the Enhancer I region of HBV CC DNA. The nucleic acids may be used to modulate the expression of HBV CC genes and HBV viral replication. Also disclosed is a method for screening CC compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds CC disease states related to HBV and HCV infection, replication and gene CC expression such as cirrhosis, liver failure, and hepatocellular CC carcinoma. The present sequence represents a substrate for one of the HBV CC disclosed in the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, C inozymes, zinzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and G-cleaver that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV C DNA. The nucleic acids may be used to modulate the expression of HBV genes and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular ribozyme, inozyme, G-cleaver, zinzyme, DNAzyme or amberzyme sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           specifically cleaves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence of a 2'-OH group within the molecule for activity. The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, hepatocellular carcinoma, cirrhosis and liver failure, either alone or in combination with other therapies such as lamivudine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this parent is also available in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Hepatitis B virus; HBV; ss; enzymatic nucleic acid; RNA hepatitis B virus infection; hepatitis; hepatocellular cirrhosis; liver failure; lamivudine; interferon; genet
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprione or more binding arms, useful for treating hepatitis and cirrhos
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     03-JUN-2004
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 17 BP; 0 A; 3 C; 7 G; 0 T; 7 U; 0 Other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       invention. electronic

The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, hepatocellular carcinoma, cirrhosis and liver failure, either alone or in combination with other therapies such as lamivadine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.

It involves contacting the test sample with means for performing a nucleic acid amplification reaction; and determining the ratio of target amplification products to internal standard amplification products present in the sample. The present sequence represents a primer/target specific probe for the hepatitis B virus (HBV) precore antigen wild-type target sequence (AAT71783). The method can be used for distinguishing between two different nucleic acid sequences present in a sample e.g. wild-type and mutant. The compositions can be used for quantitatively detecting the DNA

virus (HBV). This sequence can be used in the method of the invention for detection and/or genetic analysis of hepatitis B virus (HBV) in a sample. The method comprises: (a) optionally releasing, isolating or concentrating polynucleic acids (I) in the sample, and amplifying the relevant part of a suitable HBV gene in the sample.

The composition can be used to diagnose and/or monitor HBV mutants and/or genotypes in a sample, specifically genotype, precore mutations, vaccine escape mutations and RT gene mutations selected by treatment with drugs, e.g. lamivudume and penciclovir. (Updated on 27-AUG-2003 to correct OS field.)
   different nucleic mutant. The compos of HBV
                       A novel method has been produced for detecting the amount of a target nucleic acid sequence which may be present in a test sample. It involves contacting the test sample with means for performing a nucleic acid amplification reaction, and determining the ratio of target amplification products to internal standard amplification products present in the sample. The present sequence represents a primer/target specific probe for the hepatitis B virus (HBV) precore antigen wild-type target sequence (AAT71783). The method can be used for distinguishing between two different nucleic acid sequences present in a sample e.g. wild-type and mutant. The compositions can be used for quantitatively detecting the DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 18

                                                                                                                                                                                                                    nucleic acid sequence which may be present in a test sample. It involves contacting the test sample with means for performing a nucleic acid amplification reaction; and determining the ratio of target amplification products to internal standard amplification products present in the sample. The present sequence represents a primer/target specific probe for the hepatitis B virus (HBV) precore antigen mutant target sequence (AAT71784). The method can be used for distinguishing between two different nucleic acid sequences present in a sample e.g. wild-type and mutant. The compositions can be used for quantitatively detecting the DNA
                                                                                                                                                Sequence 19
                                                                                                                                                                                                                                                                                                                                                                                                                     A novel method has been produced for detecting the amount of a target
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Quantitative detection of target nucleic acid sequence, virus - can distinguish wild-type and mutant DNA types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Synthetic

                                             The invention relates to a short interfering nucleic acid (siNA) molecule that down-regulates expression of a hepatitis B virus (HBV) gene by RNA interference or that inhibits HBV replication. Also disclosed are the following: (i) a method of modulating the expression of a HBV gene in a tissue explant; (ii) a method of generating a library of siNA constructs having predetermined complexity; (iii) a cell containing one or more siNA molecules; (iv) a kit containing a siNA molecule which can be used to modulate the expression of a HBV target gene in a cell, tissue or corganism, and (v) a method for synthesising a siNA molecule. The siNA molecule is adapted for use to treat HBV infection, and comprises a sense and an antisense region, where the antisense region comprises sequence complementary to an RNA sequence encoding HBV and the sense region comprises the sense region and the second fragment comprises the comprises the sense region and the second fragment comprises the antisense region and the second fragment comprises the solar antisense region and the second fragment comprises the solar antisense region and the second fragment comprises the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 14-MAY-1992; 92US-008B2712.

The 3'-terminal overhangs each comprise about 2 nucleotides. The antisense region 3'-terminal overhang is complementary to RNA encoding HBV. The siNA is useful for treating human hepatitis B virus infections, and for characterising pathways of gene function, e.g. to inhibit activity of target genes in a pathway to determine the function of uncharacterised genes in gene function analysis. The siNA molecules may also be used in clinical, industrial, environmental, agricultural and/or research settings. The present sequence represents 1 of 1504 HBV siNA molecules of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 19 BP; 0 A; 3 C; 9 G; 0 T; 7 U; 0 Other;

```

New short interfering nucleic acid molecules which down-regulates expression of a hepatitis B virus (HBV) or which inhibits HBV replication, useful for treating human HBV infections or for characterizing gene function.

2003-901032/82.

Claim 11; Page 48; 72pp; English.

invention relates to a short interfering nucleic acid (siNA) molecule

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CC that down-regulates expression of a hepatitis B virus (HBV) gene by RNA
CC interference or that inhibits HBV replication. Also disclosed are the
CC following: (i) a method of modulating the expression of a HBV gene in a
CC tissue explant; (ii) a method of generating a library of slNA constructs
CC may a predetermined complexity; (iii) a cell containing one or more slNA
CC molecules; (iv)a kit containing a siNA molecule which can be used to
CC modulate the expression of a HBV target gene in a cell, tissue or
CC companism; and (v) a method for synthesising a slNA molecule. The slNA
CC molecule is adapted for use to treat HBV infection, and comprises a sense
CC complementary to an RNA sequence encoding HBV and the sense region
CC comprises sequence complementary to the antisense region. The slNA
CC molecule is assembled from 2 nucleic acid fragments, where one fragment
CC comprises the sense region and the second fragment comprises the
CC antisense region of the slNA molecule, where sense region and the
CC connected via a linker molecule. The linker molecule is a polynucleotide
CC inker or a non-nucleotide linker. The sense region comprises a 3'-
CC terminal overhang and the antisense region comprises a 3'-
CC molected via a linker molecule. The linker molecule is a polynucleotide
CC inhibit activity of target genes in a pathway so gene function, e.g. to
CC inhibit activity of target genes in a pathway to determine the function
CC inhibit activity of target genes in a pathway to determine the function
CC complementary to search settings. The present sequence represents 1 of 1504 HBV
CC sinA molecules of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

                                                                                                                                       cc following: (i) a method of modulating the expression of a HBV gene in a cc tissue explant; (ii)) a method of generating a library of siNA constructs containing predetermined complexity; (iii) a cell containing one or more siNA common generating a reduction of a HBV gene in a cc modulate the expression of a HBV target gene in a cell, tissue or cc modulate the expression of a HBV target gene in a cell, tissue or cc modulate the expression of a HBV target gene in a cell, tissue or cc modulate the expression of a HBV target gene in a cell, tissue or cc complamentary to an RNA sequence encoding HBV and the sense region comprises sequence complementary to an RNA sequence encoding HBV and the sense region comprises the sense region and the second fragments, where one fragment comprises the sense region and the second fragment comprises the consected via a linker molecule, where sense region and the coverland; the ror a non-nucleotide linker. The sense region comprises a 3'-terminal overhang and the antisense region comprises a 3'-terminal overhang and the antisense region comprises a 3'-terminal coverhang. The 3'A is useful for treating human hepatitis B virus conference rised genes in gene function analysis. The siNA molecules and settings. The siNA is useful for treating human hepatitis B virus conference region contained and the second comprises a 3'-terminal coverhang and for characterising pathway to determine the function of uncharacterised genes in gene function analysis. The siNA molecules cand/or research settings. The present sequence represents 1 of 1504 HBV cand cand cover the cove

New short interfering nucleic acid molecules which down-regulates expression of a hepatitis B virus (HBV) or which inhibits HBV replication, useful for treating human HBV infections or for characterizing gene function. gene

Claim 11; Page 41; 72pp; English.

CC following: (i) a method of modulating the expression of a HBV gene in a C tissue explant; (ii) a method of generating a library of siNA constructs CC having predetermined complexity; (iii) a cell containing one or more siNA cC molecules; (iv)a kit containing a siNA molecule which can be used to C modulate the expression of a HBV target gene in a cell, tissue or creatism; and (v) a method for synthesising a siNA molecule. The siNA CC molecule is adapted for use to treat HBV infection, and comprises a sense cc and an antisense region, where the antisense region comprises sequence complementary to the antisense region. The siNA CC molecule is assembled from 2 nucleic acid fragments, where one fragment comprises the sense region and the second fragment properties the sense region and the second fragment comprises the cc antisense region comprise separate oligonucleotides, and are covalently connected via a linker molecule, where sense region and the cc antisense region comprise separate oligonucleotides, and are covalently coverhang. The 3'-terminal overhange each comprises a 3'-terminal coverhang is complementary to RNA cc infections, and for characterising pathways of gene function, e.g. to of uncharacterised genes in a pathway to determine the function cc of uncharacterised genes in gene function analysis. The siNA molecules The invention relates to a short interfering nucleic acid (siNA) that down-regulates expression of a hepatitis B virus (HBV) gene by RU interference or that inhibits HBV replication. Also disclosed are the molecule RNA

Library constructed at Texas Tech University by Deshui Zhang and
Jiahnang Jia in the laboratory of Dr. Henry Nguyen. Sequencing was
done in the Laboratory for Genomics and Bioinformatics, University
of Georgia. Sequence ends have been trimmed to exclude vector and
regions below Phred quality 16. Three-prime sequences are presented
as their reverse complement and have been trimmed to exclude polyA.
Seq primer: JENREY (CAGGAACAGCTATGACC).

CDNA was prepared from polyA+ mRVMA using SuperScript Plasmid System Kit (Invitrogen). The double-strand cDNAs were fractionated in a sepharose C1-2B 40cm-columns and fragments sizing between 0.8 and 1.5 Kb were directionally cloned into the vector. Details of each source of RNA and library construction can be obtained at http://sucest.lad.ic.unicamp.br/public"
